SECTION 3.2

Math 1001 Worksheet

FALL 2025

For practice only. Not to be submitted.

1. Evaluate each of the following trigonometric integrals.

(a) $\int_0^{\frac{\pi}{9}} \sin^2(6x) \cos^3(6x) dx$

(b) $\int \sin^3(x) \cos^8(x) dx$

(c) $\int \sin^2(x) \cos^5(x) dx$

(d) $\int \frac{\cos^3(\ln(x))}{x} dx$

(e) $\int x \sin^2(x) dx$

(f) $\int \frac{1 - \tan^2(x)}{\sec^2(x)} dx$

2. Strategies similar to those introduced for integrals of the form $\int \sin^m(x) \cos^n(x) dx$ can also work for combinations of $\sec(x)$ and $\tan(x)$ functions, and for combinations of $\csc(x)$ and $\cot(x)$.

- (a) Consider $\int \tan^5(x) \sec^5(x) dx$. Evaluate the integral as follows:

- set aside a factor of $\sec(x) \tan(x)$
- transform the remaining factors of $\tan(x)$ into $\sec(x)$ using the identity $\tan^2(x) + 1 = \sec^2(x)$
- use u -substitution with $u = \sec(x)$.

- (b) Consider $\int \frac{\cos^2(x)}{\sin^6(x)} dx$. Although this integral involves $\sin(x)$ and $\cos(x)$ functions, it cannot be evaluated using the techniques introduced in class. Show that it can be evaluated as follows:

- rewrite the integrand in terms of $\cot(x)$ and $\csc(x)$ functions
- set aside a factor of $\csc^2(x)$
- transform the remaining factors of $\csc(x)$ into $\cot(x)$ using the identity $1 + \cot^2(x) = \csc^2(x)$
- use u -substitution with $u = \cot(x)$.
